Thornless Honeylocust

30-70'
30-70'

Pennsylvania to Nebraska, south to Texas and Mississippi

The Thornless Honeylocust is a fast-growing, fine-textured deciduous tree. Habit is open and spreading, providing light shade. Leaves are compound and bright green. Fall color is yellow-green, with leaves dropping earlier than most other trees. Long, twisted, brown fruit pods develop in late Summer. The tree gets its name from the sweet, sticky pulp it produces.

FAMILY

Fabaceae

GENUS

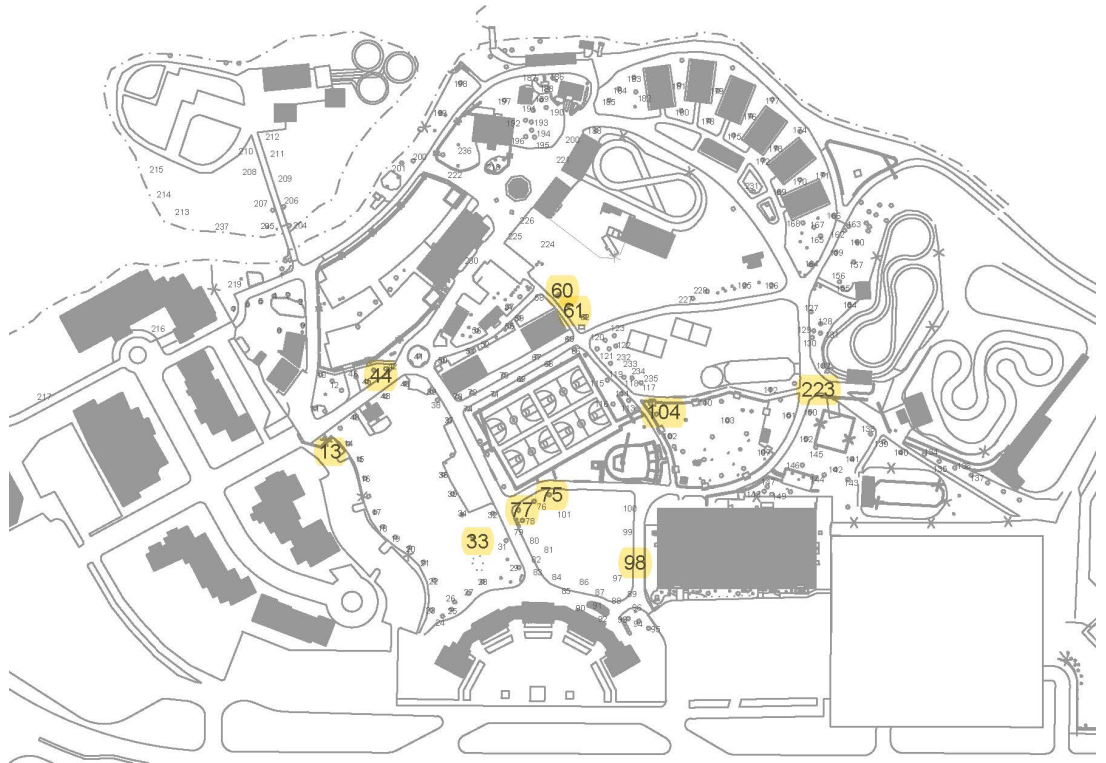

Gleditsia

SPECIES

triacanthos var. inermis
